TITLE: Radial burning of trees in the vicinity of the explosion of the Tungus meteorite

SOURCE: AN SSSR. Komitet po meteoritam. Meteoritika, no. 24, 1964. Trudy\* Desyatoy Meteoritnoy konferentsii v Leningrade 29 maya - 1 iyunya 1962 g., 129-140

TOPIC TAGS: meteorite, Tungus meteorite, meteorite explosion

ABSTRACT: Everywhere in the neighborhood of the explosion of the Tungus meteorite, in an area with a radius of approximately 20 km from the epicenter, there still remain obvious traces of a forest fire which undoubtedly accompanied the 1908 explosion and which does not show the characteristics of an ordinary forest fire. The reason for the fire was light radiation from the explosion and the fire developed simultaneously over a large area (with a radius of more than 9 km from the site of the explosion) in places where conditions were favorable for combustion (underbush, dry branches, etc.). The light radiation of the explosion also caused the overheating and destruction of the cambium of small larch branches on that side of the branches turned toward the center of the explosion. The direction of damage to

Card 1/3

ACCESSION NR: AT4035838

the branches has made it possible to compute the coordinates of the radiation source with a rather high accuracy, leading to the conclusion that the principal source of radiation was the explosion of a body in the air. The data do not make it possible to estimate the influence of light radiation of the body in the atmosphere before the explosion or determine the configuration of the light source, but further collection of data probably would furnish an answer to these questions. The relative locations of the center of flattening of the forest suggest that the path followed by the body was from southeast to northwest. Precise determination of the path requires that the influence of the wind be taken into account. The centers of radiation and forest flattening are indicated in Fig. 1 of the Enclosure. An estimate of the luminous energy of the explosion has been made, but the accuracy is very low. "In conclusion the authors wish to thank K. P. Florenskiy, chief of the expedition, and other participants, for their useful advice". Orig. art. has: 7 figures and 2 tables.

TITLE: Maximum asymmetric transient current and torque in reversible induction-motor drives with high-speed control

SOURCE: <sup>29</sup>Sverdlovsk. Ural'skiy politekhnicheskiy institut, Trudy, no. 138, 1964. Issledovaniye elektromagnitnykh i elektromekhanicheskikh protsessov mashin peremennogo toka (Research on electromagnetic and electromechanical processes in a. c. machines), 152-161

TOPIC TAGS: electric motor, induction motor, industrial automation

ABSTRACT: Essentially, a review is presented of 8 published Soviet works which also include some earlier author's articles. The maximum asymmetric current and electromagnetic torque that occur in large 3-phase induction motors upon a counter-torque braking (plugging) are analytically evaluated. Estimates for type A motors indicate that the maximum current occurs under 180-electrical-degree plugging

Card 1/2

conditions and may reach 14-10 times normal (switching interruption time,  $4\tau$  to  $40\tau$ ). Thus, with automatic braking equipment, the current peaks may reach values as high as 3 times sustained short-circuit value. Plots of current and torque vs. switching angle are shown, as are 4 oscillograms of the plugging process in an A-51-6 motor. Quick field discharge during the circuit interruption is suggested as a remedy for the undesirable strong mechanical shocks in the drive. One such field-discharge arrangement has been adopted at the Mechanical Department of the Berezniki Soda Plant. Orig. art. has: 3 figures and 18 formulas.

TITLE: A digital computer with programmed circuit control. Class 42, No. 174844

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 18, 1965, 91-92

TOPIC TAGS: digital computer, automatic computer programming, self adaptive control

ABSTRACT: This Author Certificate introduces a digital computer with programmed circuit monitoring. The unit contains a control counter, instruction memory, instruction readout amplifier, instruction register, operation decoder, central control unit, control pulse amplifiers, arithmetic unit, working storage, and an input output device. The installation is designed for automatically and accurately finding elements that fail. The computer contains a microoperation zone decoder and a pilot signal shaper which are connected together and to the readout amplifiers for the instruction memory. The outputs from the pilot signal shaper are connected to the central control unit, the local control unit, and the control signal amplifier

Card 1/3

L 2615-66

ACCESSION NR: AP5025743

unit. The computer also contains a microcontrol unit which is connected to the central control unit and to the control signal amplifiers, and a device for recording the point of failure, which is connected to the instruction memory readout amplifiers. A modification of this computer is designed for transition from macrooperation to microoperation conditions to improve the resolution of diagnostic tests. The microcontrol unit in this computer contains the first gate for interpretation of operating conditions. The inputs to this gate are connected respectively to the unit for sampling commands from the instruction memory and to the flip-flop for storage of operating conditions. The output from this flip-flop is connected to a delay circuit through gates which are connected to the outputs from the microoperation zone decoders which correspond to microoperations for setting the flip-flops of the computer. The delay circuit is connected through a gating assembly to the outputs from the control signal amplifiers. The output from the delay circuit is connected to the input of the instruction sampler. The second gate for interpretation of operating instructions is connected to the input of the delay circuit. The inputs to this gate are connected respectively to the instruction sampler and to the inverse output from the flip-flop for storage of operating conditions through the gate for transition from macrocontrol to microcontrol conditions. The output from the delay circuit is connected in parallel with the output from the first gate for

Curd 2/3.

2

interpretation of operating conditions. In a second modification of this computer, the number of points which can be monitored is increased by using an input register in the microoperation zone decoder. This register is connected to the decoder, and the outputs from the decoder are connected to the control points. In a third modification of this computer, indication of a point of failure is simplified by using an input register in the failure indicator with binary-digital code for the number of the non-operative element. This register is connected to decimal indicators through a decoder which converts the register code into decimal positional notation. A fourth modification of this computer is designed for automatically and accurately locating points of failure. The pilot signal shaper in this computer contains gates with inputs connected respectively to the microoperation zone decoder and to the readout amplifiers for the instruction memory. The outputs from these gates are connected to the elements to be monitored. [14]

TITLE: Designing a computer of an extremal regulator for heat processes

SOURCE: Ref. zh. Kibernetika, Abs. 8G107

REF SOURCE: Pribory i ustroystva sredstv avtomatiki i telemekhan. Resp. mezhved. nauchno-tekhn. sb., vyp. 1, 1965, 99-108

TOPIC TAGS: heat regulation, computer, extremal heat regulator

ABSTRACT: Systems of extremal regulation are investigated which consist of:  
1) a nonlinear inertialess element whose input value  $x$  (regulating action) and output value  $y$  (static value of extremum—EV) are coupled by the equation

$$y = F[x, a(t), b(t), \dots, e(t)],$$

where  $a(t), b(t), \dots, e(t)$  are the variable parameters which determine the extremum static characteristic; 2) a linear element whose input value  $y$  and output

Card 1/3

UDC: 62-506

ACC NR. AR6035231

value  $\theta$  (current value of EV) are coupled by the differential equation

$$a_n \frac{d^n \theta}{dt^n} + \dots + a_1 \frac{d\theta}{dt} + \theta = k_{ey};$$

3) a pickup unit for measuring the current value of EV; and 4) a step-type extremal regulator. To decrease the influence of linear element inertia, a static value of EV is introduced in the logic element of the extremal regulator, i. e., a regulation law is constructed in the form

$$\Delta x_{n+1} = \alpha \operatorname{sign} \Delta y_n \operatorname{sign} \Delta x_n,$$

where  $\Delta y_n$  is the increment of the value of EV. For the case when transients in the linear part of the object of regulation and in the pickup unit are described by differential equations of the first order, an algorithm of the operation of the extremal regulator computer is derived. It is shown that the value of  $\operatorname{sign} \Delta y_n$  required for realizing the regulation law can be calculated on the basis of signal increments at the pickup output. A computer circuit which uses summing transformers with a phase-sensitive amplifier is described. To improve the noise immunity of the extremal regulation system, it is necessary to calculate the increment of EV on the basis of the increments of the signal from the pickup which

Card 2/3

ACC NR: AR6035231

must be averaged per regulation cycle. The paper has four illustrations and a bibliography of 10 titles. [Translation of abstract] [DW]

TITLE: Controlled directional reception in the study of the rim zone of the Caspian depression

SOURCE: Ref. zh. Geofizika, Abs. 9D105

REF SOURCE: Tr. Nizhne-Volzhsk. n. -i. in-t geol. i geofiz. vyp. 3, 1965, 131-136

TOPIC TAGS: seismic observation, controlled directional reception, profiling, disjunctive dislocation, geologic exploration/Caspian depression

ABSTRACT: Seismic observations were made using controlled directional reception in one and one-and-half stage continuous profiling. Distances between short points were 200-800 m, the magnitude of the summation base was 160-200 m, and groups of five seismographs per 12-25 m base were used. Results obtained at the Ural and Yeruslan area sections (northern part of the rim area) and at the Lamyshinskaya section are given. The high effectiveness of

Card 1/2

UDC: 550.834.5

ACC NR: AR6035275

the controlled directional reception in plotting salt and subsalt deposits and in identifying disjunctive dislocations is demonstrated. For complex areas, it is recommended that a system of double profiling be incorporated when using the controlled directional method and that parametric wells be drilled in the inside part of the rim zone. TITLE: East-alpine earthquake of 2 December 1963

SOURCE: <sup>12</sup> Studia geophysica et geodaetica, v. 9, no. 3, 1965, 302-305

TOPIC TAGS: earthquake, seismography, physical geology

ABSTRACT: This article presents a brief evaluation of the available macroseismic material on the earthquake that occurred on 2 Dec 63, which had its focus ( $\phi = 47.9^\circ N$ ,  $= 16.4^\circ E$ ) 40 km south of Vienna, and deals with the relation between the shape of the macroseismic field and the geological structure of the quaked area. The authors thank Doctor J. Vanek and Engineer V. Karnik for their valuable advice. They also thank their Austrian, German, and Hungarian colleagues for the macroseismic material they supplied. TITLE: The Precision of Exploratory Sections (O tochnosti  
razvedochnykh razrezov)

PERIODICAL: Sov. Geologiya, Nr 49, 1955, pp 146-165.

ABSTRACT: Exploratory sections are distinguished from sections that accompany geologic maps by their greater precision, by greater objectivity, and by a more specific purpose. The precision of exploratory sections is variable and depends on the complexity of the geological structure of the area and on the procedure employed in making the survey. Using a comparative method of determining precision, the author recommends the use of a scale of relative geological precision for sections, providing different methods for constructing them (by continuous and direct tracing of the outlines of ore bodies or by different methods of geological interpretation or

Card 1/2

15-57-1-946

The Precision of Exploratory Sections (Cont.)

extrapolation) and also a scale of relative exploratory precision for sections depending on the nature and quality of mining operations and drilling (sections constructed chiefly from mining operations, fully or incompletely embracing intersections of ore bodies, and sections constructed from curved or noncurved drill holes, with complete or partial recovery of cores, etc.). A combined use of scales permits one to obtain a picture of the general geological-exploration precision for the sections, but it is not possible to unite both scales into one. The scale for geological precision may be used for the concentration of sites of exploratory operations, and the scale of exploratory precision may be used for evaluating the quality of drilling operations. Both scales may be used for computing reserves to evaluate the reliability of the latter.

## TITLE:

The Connection Between the Number of Revolutions and the Axle Load, in Turbo Drilling, Which Guarantees an Efficacious Destruction of Rock (Zavisimost' mezhdueh chislom oborotov i osevoy nagruzkoey pri turbinnom burenii, obespechivayushohey effektivnoye razrusheniye gornykh porod)

## PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy. Nefi' i gaz, 1959, Nr 3, pp 39-41 (USSR)

## ABSTRACT:

At a constant temperature the stability  $\tau$  of a loaded material depends on the weight  $\sigma$ :

$$\tau = Ae^{-\alpha \sigma} \quad (1)$$

A and  $\alpha$  are coefficients which depend on the material and the temperature. As all deformations that follow the law of Hooke have the same shape of the diagram and the same dependence of the deformation on time, an analogous function is to be expected for drilling. For the duration  $t_z$  of the contact of a milling cutter tooth with the rock the equation applies:

Card 1/3

The Connection Between the Number of Revolutions  
and the Axle Load, in Turbo Drilling, Which Guarantees  
an Efficacious Destruction of Rock

SOV/152-59-3-8/25

$$t_z = \frac{60 \frac{d}{D}}{zn} \quad (2)$$

d = diameter of the milling wheel, D = diameter of the drill  
z = number of teeth of the milling wheel, n = number of  
revolutions. The force with which the tooth of the milling  
cutter hits the rock is proportional to the axle load (G):  
 $\sigma = kG$  (3) (k = coefficient that depends on the construction  
of the drill). Therefrom results the equation:

$$\frac{60 \frac{d}{D}}{zn} \geq A e^{-\alpha kG} \quad (4)$$

An increase of the number of revolutions must, therefore, be  
accompanied by an increase of the axle load in order to obtain  
the same effect of destruction. The connection between the  
axle pressure and the number of revolutions appears from the  
equation (3):

Card 2/3

The Connection Between the Number of Revolutions and the Axle Load, in Turbo Drilling, Which Guarantees an Efficacious Destruction of Rock SOV/152-59-3-8/25

$G \geq A_0 + B_0 \ln n$  (5), wherein  $A_0 = \frac{\ln AD + \ln z - \ln d}{\alpha k}$  and

$B_0 = \frac{1}{\alpha k}$ . The number of revolutions of turbo drills is determined by the quantity  $Q$  of the scavenging liquid. Here, too, the axle load must be increased when the supply of scavenging liquid is increased. The connection appears from:  $G \geq A_1 + B_0 \ln Q$  (6)

$A_1 = A_0 + B_0 \ln k_1$  ( $k_1$  = coefficient that depends on the construction of the turbo drill). When in hard rock and with a given number of revolutions the load claimed in equation (5) cannot be obtained, a drill with a higher tooth pitch is to be applied. There are 2 figures and 4 Soviet references.

"Utilization of Various Models of Milling Gouges," V. S. Fedorov, F. D. Zenkov, Groznyy, 8 pp

"Neft Khozyay" No 1

In earlier article, "Use of Blade and Milling Gouges," Federov set up various conditions that would define the type of gouge to be used. Authors limit the field somewhat and discuss the conditions which would result in the selection of certain types of milling gouges for certain types of rock. Name some 15 different types of gouges. Also discuss some of the deficiencies of milling gouges.

TITLE: SAP made from secondary aluminum

SOURCE: Alyuminiyevy\*ye splavy\*. Sbornik statey, no. 2. Spechenny\*ye splavy\*. Moscow, 1963, 28-30

TOPIC TAGS: powder metallurgy, sintered aluminum, aluminum powder, sintered aluminum powder, primary aluminum, secondary aluminum, SAP

ABSTRACT: Grade A0 and A00 primary aluminum is normally used for manufacturing grade APS aluminum powder. The problem of using aluminum powder made of grade ATsV secondary aluminum (1.1%  $Al_2O_3$ ; 3.1% Si; 2.88% Cu; 1.56% Zn; 1.1% Fe; 0.01% Mn; 0.03%  $H_2O$ ; the rest Al, with a specific gravity of 1.15) was solved by a series of tests investigating the mechanical properties and corrosion resistance of such blanks. These tests showed that at temperatures up to 350C, the ultimate strength of SAP from secondary aluminum containing 7%  $Al_2O_3$  (45 kg/mm<sup>2</sup> at 20C and 15 kg/mm<sup>2</sup> at 300C) is higher than that of SAP from primary aluminum. The relative elongation (4% at 20C, 6% at 300C), on the other hand, was lower than that of SAP from primary aluminum at temperatures up to 100-120C and higher at

120-500C. This resembles the behavior of Cu-alloyed SAP. The corrosion resistance of SAP made of secondary aluminum (3% NaCl + 0.1% H<sub>2</sub>O<sub>2</sub> for 2 months) is lower than for SAP of primary aluminum, but higher than for alloy D16. Orig. art. has 2 figures and 1 table.

Teploprochnyy material iz spachennoy alyuminiyevoy pudry [SAP]; sbornik statey (Heat-Resistant Material From Baked Aluminum Powder [SAP]; Collection of Articles) Moscow, Oborongiz, 1961. 122 p. Errata slip inserted. 3,550 copies printed.

Reviewers: M. F. Bazhenov, Engineer, and M. Yu. Bal'shin, Candidate of Technical Sciences; Ed.: M. A. Bochvar, Engineer; Ed. of Publishing House: S. I. Vinogradskaya; Tech. Ed.: V. I. Oreshkina; Managing Ed.: A. S. Zaymovskaya, Engineer.

PURPOSE : This collection of articles is intended for scientific workers and engineers in the institute and plant laboratories of the metallurgical and machine-building industry; it may also be useful to instructors and advanced students.

COVERAGE: The 12 articles contain the results of research on the structure, properties, and manufacture of semifinished products

from sintered aluminum powder. The technology for the manufacture of aluminum powder and briquets is described as are sintering processes, and pressing, rolling, drawing, and sheet-stamping methods. The dependence of the properties of semifinished products on the aluminum-oxide content of the powder, on the degree of hot and cold deformation, and on the stresses of pressing is investigated. Also investigated are the mechanical and corrosive properties of semifinished products, the mechanism of hardening of sintered aluminum powder, the reasons for blister formation, and the possibility of recrystallization. Data on sintered aluminum alloys are included. No personalities are mentioned. References in the form of footnotes accompany the articles.

TITLE: Aluminum powder for high-strength SAP alloy

SOURCE: Alyuminiyevyye splavy, no. 4, 1966. Zharoprochnyye i vysokoprochnyye splavy (Heat resistant and high-strength alloys), 214-218

TOPIC TAGS: aluminum alloy, aluminum powder, TENSILE STRENGTH, high strength alloy, sintered aluminum powder, ~~sintered aluminum powder alloy~~, metal property/SAP aluminum alloy

ABSTRACT: SAP-1 and SAP-2 alloys made of APS-1 and APS-2 grade aluminum powder (respective content of aluminum oxide 6-9 and 9-13%) have a tensile strength of 26-32 kg/mm<sup>2</sup> and 32-38 kg/mm<sup>2</sup>, respectively. By increasing the content of aluminum oxide to 23% the strength of alloys can be increased up to 45 kg/mm<sup>2</sup>. Two new grades of aluminum powder were developed: APS-3 with 13-18% aluminum oxide and APS-4 with 18-23% aluminum oxide. Since the content of aluminum oxide depends on the fineness of the powder, which in turn depends on the duration of grinding (APS-1 and APS-2 powders require 25 and 35 hr grinding), the grinding process was modified to accelerate oxidation and lower the consumption of stearic acid (which is added to prevent the agglomeration of powder particles). SAP alloys made from APS-3 and APS-4 powders

Card 1/2

L 40990-66

have a tensile strength of 40—50 kg/mm<sup>2</sup> at room temperature and 13—15 kg/mm<sup>2</sup> at 500C, which makes it possible to use these alloys in structures operating at 350—500C instead of steels and titanium alloys. Orig. art. has: 2 figures and 1 table. [TD]
